Detailed description of project						Type of services provided		
 Organisation and implementation of an integrated environmental protection management plan for the island of Salamina and presentation of action plans and strategic programming and proposals regarding a period of time until the year 2020. Water quality, hydrodynamic and pollution prediction modeling has been utilized in combination with satellite imagery to improve estimations and integrate predictions. Salamina, due to its geographical position, has suffered from severe pollution and environmental degradation, both in marine and coastal areas. It is considered to be a pilot-island for the implementation of a series of demonstration pilot projects in the areas of municipal waste management, nature conservation and coastal management in islands.
